

ENGINEERS OF FLOW

LTW delivers components for high bay warehousing systems: stacker cranes, conveyors, software. So far, so good.

However, the central focus of our work is not the individual components, but rather the overall usability by the customer: perfect material flow, seamless projects, precise timing, open communication, rapid-response service – in one word: flow.

SOLUTIONS PAVE OUR WAY

More than 850 successfully implemented projects – each posing specific questions and requiring a precisely-engineered solution to suit the customer’s individual needs. There is hardly a question in the area of intralogistics for which LTW has not successfully found an answer.

Calling upon more than three decades of experience, LTW also supplies specialized solutions. For example, long-load warehousing or frozen and refrigerated goods warehousing. Today the efficient manufacture of standardized components provides a new degree of flexibility in the creation of individual overall solutions.

WHAT ONE BRINGS TO AN END MUST ALSO HAVE A BEGINNING

Whether high bay warehousing, self storage, automated boat or document storage systems: LTW is delivering more and more complete systems comprised of stacker cranes, conveyors, control systems, and selfdesigned software.

In the end phase of projects, we are responsible for ensuring that your warehousing facility is commissioned on time and without a hitch, and is then handed over to you ready for use.

This key role also makes us the perfect general contractor for intralogistics. We understand the work objectives and can foresee potential difficulties. The earlier we are included in the customer's planning process, the smoother we can make the path to fulfilling the intended objectives.

MAXIMUM CONSTRUCTION HEIGHT? 4,848 METERS ABOVE SEA-LEVEL

Pallets in an LTW high bay warehouse can also feel safe on the uppermost levels. This is because our products are built to cable car standards, i.e. using the same meticulous care in construction, the same long-welded, certified materials, the same qualified technicians employing the same standards of quality assurance as the cable cars manufactured by the global market leader in cable car technology, Doppelmayr.

The Doppelmayr Group has had the same stable ownership structure since 1893 and includes about 2,600 employees today, having installed more than 14,600 facilities worldwide.

LTW Intralogistics GmbH is a company of the Group and currently employs 200 people.

EXPORT OF EXPERTISE

The experience we have gained in our home market also applies to every corner of the world. Intralogistics is not a question of geography. Installed projects in more than 30 different countries are pointing this out.

LTW is currently expanding from its head office in Austria with increasing momentum. The German and American markets are being supplied by our subsidiary companies in Ulm-Illerkirchberg and Emigsville/Pennsylvania respectively. Partners and consultants in Moscow, Singapore, Mexico, Scandinavia and on the Arabian Peninsula promote expansion in the dynamic markets all over the world.

Selected partners in the area of on-site customer service guarantee rapid-response and direct communication.
